

# Release Note

Release Date : June. 2014

Product Ver. : GTSNX 2014 (v2.1)

**GTS NX**  
Geo-Technical analysis System New eXperience

Integrated Solver Optimized for the next generation 64-bit platform  
**Finite Element Solutions for Geotechnical Engineering**

**MIDAS**

## Enhancements

### 1. Pre Processing

- 1.1 Embedded Beam Element
- 1.2 Geological Parameters DB
- 1.3 Repair Shape (Topology Optimize)
- 1.4 Model Simplification (Remove small entity)

### 2. Analysis

- 2.1 Hardening Soil (MMC Hardening)
- 2.2 Soft Soil Creep (Secondary Consolidation)
- 2.3 Geometric Nonlinear Effects  
(Estimate Initial configuration)
- 2.4 Concrete Creep & Shrinkage  
(Time-dependent behavior)
- 2.5 General Contact Element (Contact Analysis)

### 3. Post Processing

- 3.1 3D → 2D Section (Save & Export to SoilWorks)
- 3.2 3D PDF Report  
(Improvement in data summary)
- 3.3 Relative deformed shape for Dynamic analysis results
- 3.4 Improvement in Probe result

### \* Appendix

Creep / Shrinkage Function Group

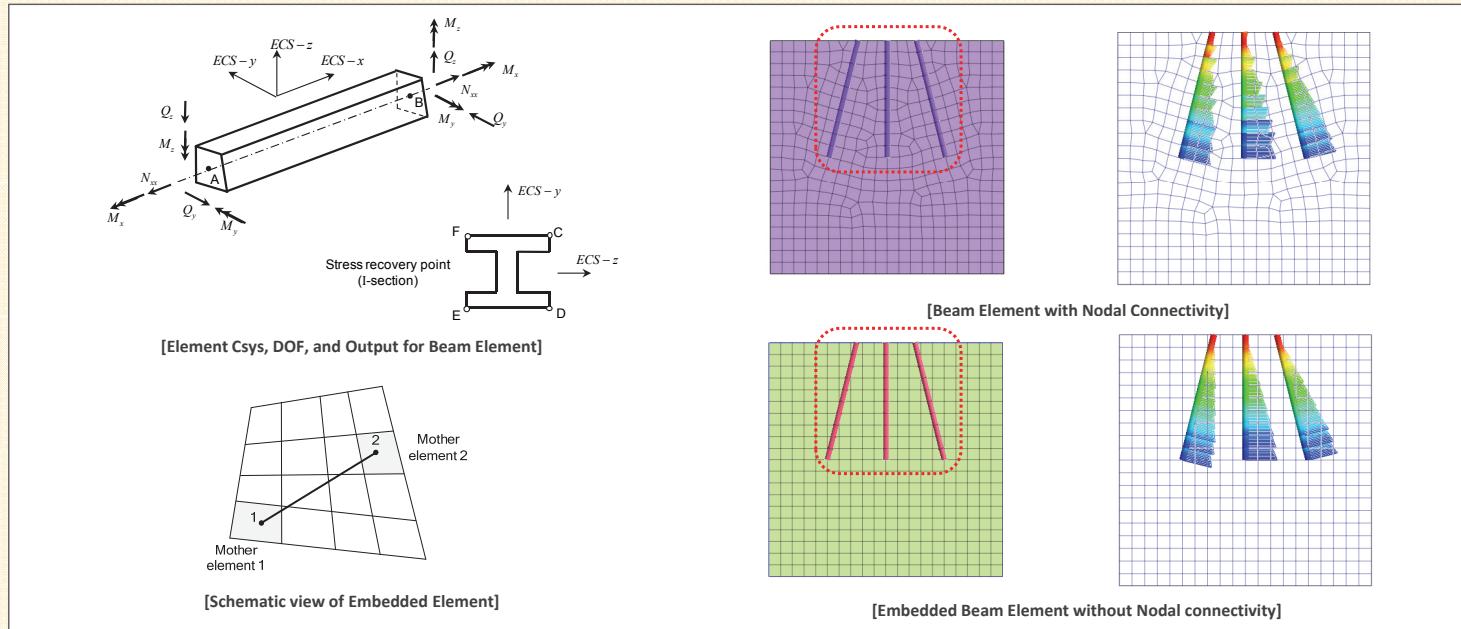

Integrated Solver Optimized for the next generation 64-bit platform  
**Finite Element Solutions for Geotechnical Engineering**

**MIDAS**

## 1. Pre Processing

### 1.1 Embedded Beam Element

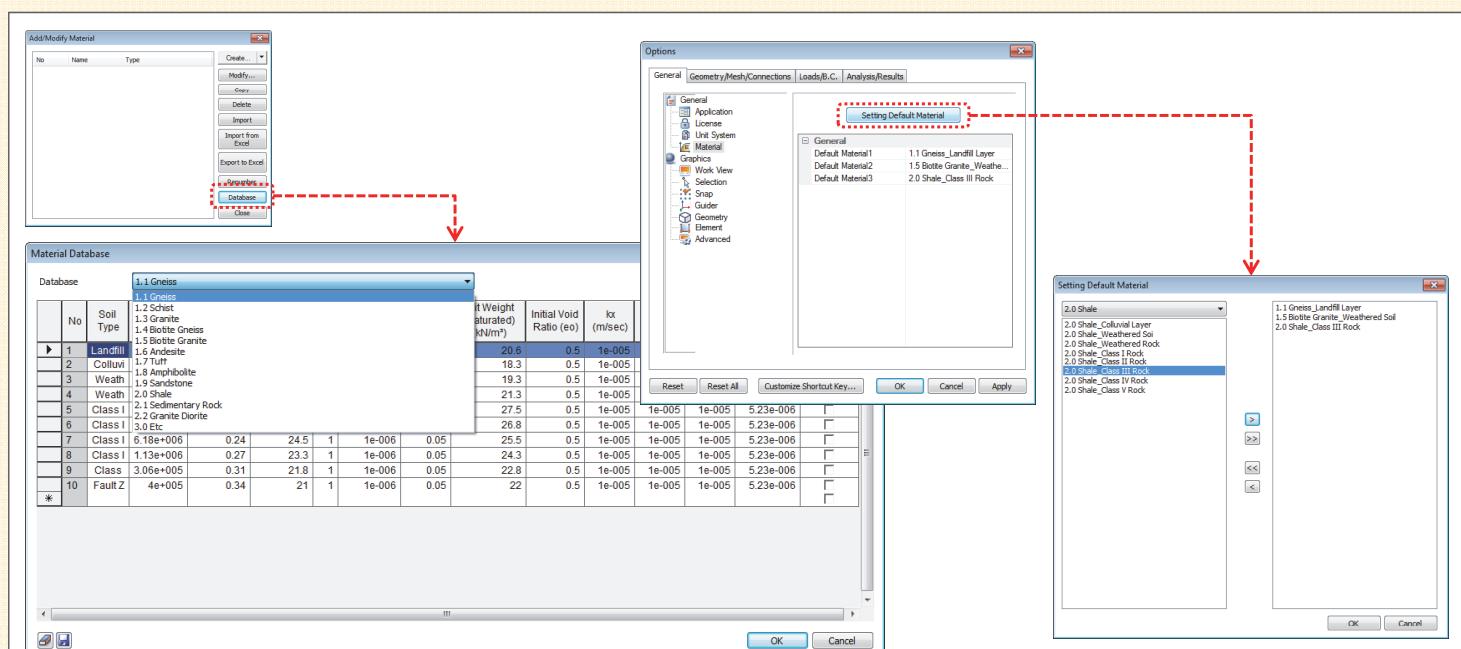

- Beam element must have a node connection with the surrounded element, otherwise embedded beam element can make a node connection with Mother element automatically.
- Beam and Embedded beam element have the same DOF(degree of freedom), so can be used for the same purpose, but even a node of Embedded element cannot protrude from Mother element.
- Embedded Beam Element are available in both 2D and 3D.
- In case of embedded structures like pile foundation or pipeline umbrella for tunnel, embedded beam element can be used to model those conveniently.

## 1. Pre Processing

### 1.2 Geological Parameters DB (Database)

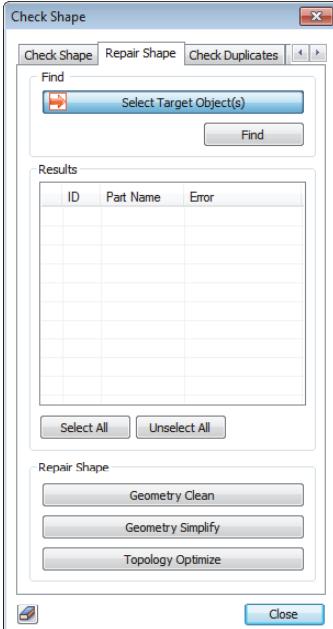

- Provide database for general parameters of soil ([Mesh > Prop./Csys./Func. > Material > Database](#))
  - The user can customize database ([C:\Program Files\MIDAS\GTS NX\Database](#))
- (Users can add or change \*.gdb files. Notepad (text editor) can be used to open this kind of file)
- The user can set default material for frequently used parameters. ([Tools > Options > General > Material](#))

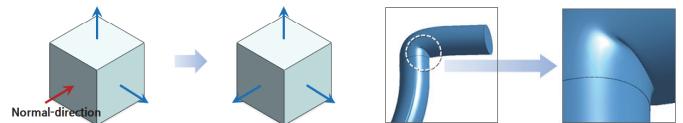

## 1. Pre Processing

### 1.3 Repair Shape (Automatic)

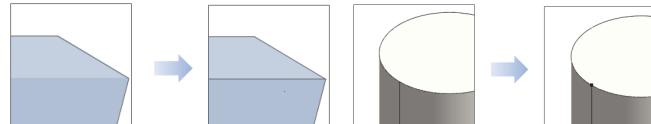

- Geometry > Tools > Check Shape > Repair Shape**
- Find and modify geometric errors automatically for atypical and inaccurate shape
- Recommend to perform "Geometry Clean → Geometry Simplify → Topology Optimize" continuously
- The user can perform this function when have failed to create mesh for selected geometry

**Geometry Clean : modify invalid shape**

[Abnormal topology] [Tangled shape]

[Omission of Edge or vertex]

**Geometry Simplify : modify irregular shape**

- ✓ B-Spline surface → plane, cylinder, sphere, cone and torus
- ✓ B-Spline curve → line, circle and ellipse
- ✓ Irregular shape → normalized and primitive shape

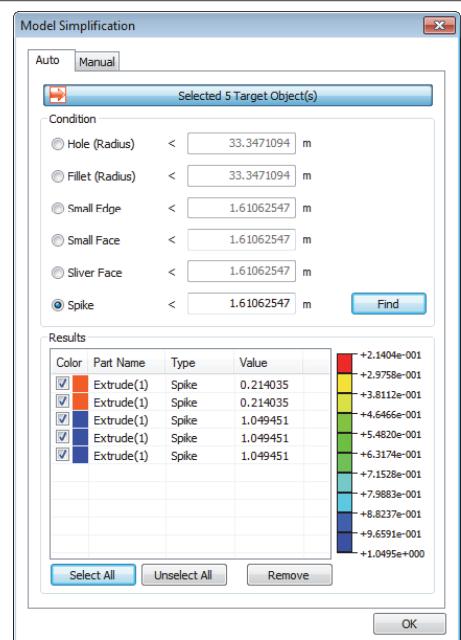

**Topology Optimize : performance improvement in creating mesh**

- ✓ Simplify geometry and delete duplicated edge/surface automatically
- ✓ Delete unnecessary edge or vertex automatically

## 1. Pre Processing

### 1.4 Model Simplification (Auto)

- Geometry > Remove > Face / Edge**
- Find entities within the range of defined criteria and remove to simply geometry
- Recommend to remove small edge and face to create better quality of mesh
- The user can perform this function when have failed to create mesh with inputted size for selected geometry

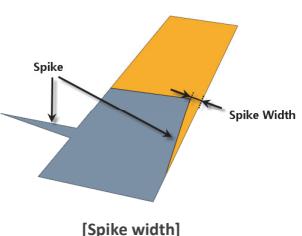

**Auto : find and remove selected entities automatically**

- ✓ Hole (Radius) : Input radius of hole
- ✓ Fillet (Radius) : Input radius of fillet
- ✓ Small Edge : Input the length of edge
- ✓ Small face : Input the length for the longest edge of face
- ✓ Silver Face : Input the width of strip
- ✓ Spike : Input the width of spike

**Results:** All entities which meet criteria are listed in the dialog.

- ✓ Selected entities will be highlighted in the model view
- ✓ Double click on the selected entity to fit zoom to window

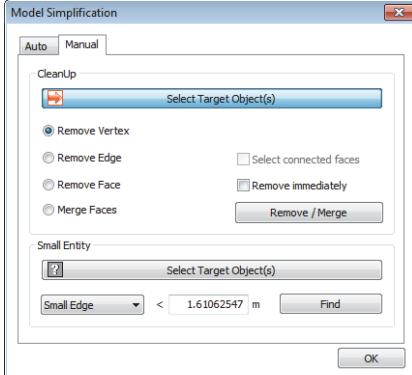

[Spike width]

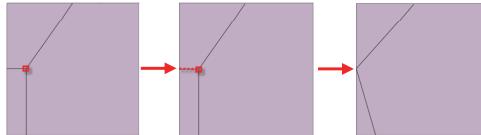

## 1. Pre Processing

### 1.4 Model Simplification (Manual)

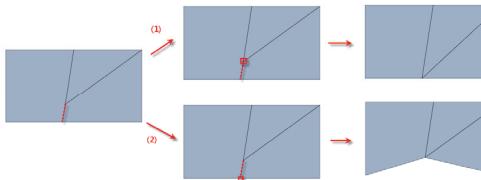

- Geometry > Remove > Remove Manual**
- Find and remove entities to simplify geometry
- Recommend to remove small edge and face to create better quality of mesh
- The user can perform this function when have failed to create mesh with inputted size for selected geometry

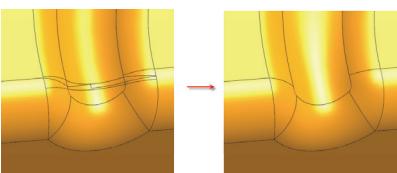

**Remove Vertex :** remove the shortest edge of ones which are connected to the selected vertex

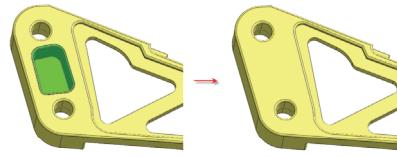

**Remove Edge :** remove selected edge and corresponding vertex at the same time

**Merge Faces :** merge faces with removing selected edge

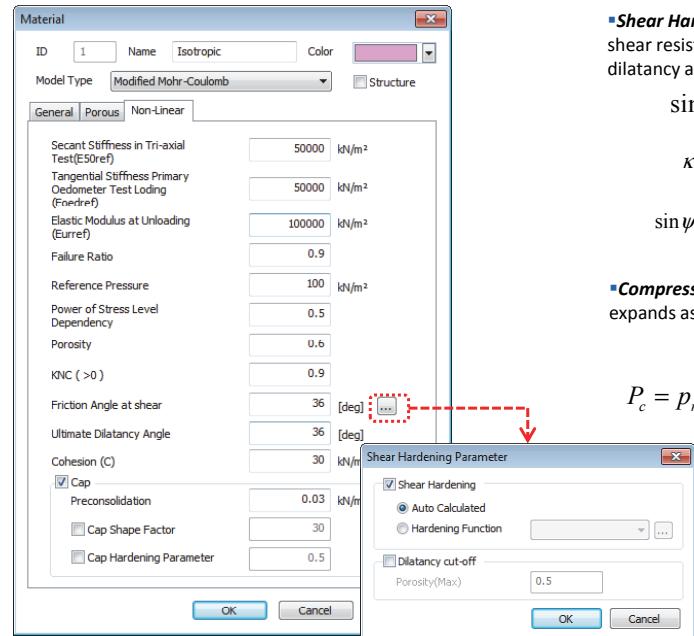

**Remove Face :** remove selected face and merge

## 2. Analysis

### 2.1 Hardening Soil (MMC Hardening)

- Improvement in additional parameters to simulate **Shear and Compression hardening** simultaneously
- Three types of Elastic modulus can be defined
- Shear hardening parameter can be calculated automatically and Preconsolidation is used for compression hardening behavior
- Reasonable and applicable model especially for soils such as sand, silt and OC Clay.

**Shear Hardening :** can be defined by Equivalent plastic strain related to the mobilized shear resistance. When the soil is subject to shear hardening, solver recalculates dilatancy angle. Shear yield surface can expand up to the Mohr-Coulomb failure surface.

$$\sin \phi = \sin \phi(\kappa)$$

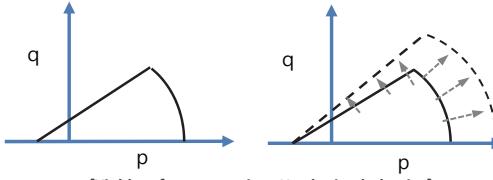

$$\kappa = \sqrt{\frac{2}{3} \gamma^p : \gamma^p}$$

$$\sin \psi = \frac{\sin \phi - \sin \phi_{cv}}{1 - \sin \phi \sin \phi_{cv}}$$

**Compression Hardening :** can be defined by pre-consolidation stress. Cap yield surface expands as a function of the pre-consolidation stress

$$P_c = p_{ref} \left( \left( \frac{P_{c0}}{p_{ref}} \right)^m + \frac{m}{\Gamma} \Delta \epsilon_v^p \right)^{\frac{1}{m}}$$

$P_c$  : Pre-consolidation stress  
 $P_{c0}$  : Pre-overburden pressure (or OCR)  
 $\Gamma$  : Cap hardening parameter

## 2. Analysis

### 2.1 Hardening Soil (Review of model parameters)

Material	
ID	1
Name	Isotropic
Color	
Model Type	Modified Mohr-Coulomb
<input type="checkbox"/> Structure	
General	
Secant Stiffness in Tri-axial Test(E50ref)	50000 kN/m <sup>2</sup>
Tangential Stiffness Primary Oedometer Test Lodging (Eoedref)	50000 kN/m <sup>2</sup>
Elastic Modulus at Unloading (Eurref)	100000 kN/m <sup>2</sup>
Failure Ratio	0.9
Reference Pressure	100 kN/m <sup>2</sup>
Power of Stress Level Dependency	0.5
Porosity	0.6
KNC (>0)	0.9
Friction Angle at shear	36 [deg] <input style="border: 1px solid red; padding: 0 2px;" type="button" value="..."/>
Ultimate Dilatancy Angle	36 [deg]
Cohesion (C)	30 kN/m <sup>2</sup>
<input checked="" type="checkbox"/> Cap	Preconsolidation
<input type="checkbox"/> Cap Shape Factor	0.03 kN/m <sup>2</sup>
<input type="checkbox"/> Cap Hardening Parameter	30
<input type="checkbox"/> Cap Hardening Parameter	0.5

Parameter	Description	Reference value (kN, m)
Soil stiffness and failure		
E50ref	Secant stiffness in standard drained triaxial test	$E_i \times (2 - R_f) / 2$ ( $E_i$ = Initial stiffness)
Eoedref	Tangent stiffness for primary oedometer loading	E50ref
Eurref	Unload / reloading stiffness	$3 \times E50ref$
m	Power for stress-level dependency of stiffness	$0.5 \leq m \leq 1$ (0.5 for hard soil, 1 for soft soil)
c	Effective cohesion	Failure parameter as in MC model
$\phi$	Effective friction angle	Failure parameter as in MC model
$\psi$	Ultimate dilatancy angle	$0 \leq \psi \leq \phi$
Advanced parameters (Recommend to use Reference value)		
Rf	Failure Ratio (qf / qa)	0.9 (< 1)
Pref	Reference pressure	100
KNC	Ko for normal consolidation	$1 - \sin\phi$ (< 1)
Dilatancy cut-off		
Porosity	Initial void ratio	-
Porosity(Max)	Maximum void ratio	Porosity < Porosity(Max)
Cap yield surface		
Pc	Pre-overburden pressure (or from OCR)	-
$\alpha$	Cap Shape Factor (scale factor of preconsolidation stress)	from KNC (Auto)
$\beta$	Cap Hardening Parameter	from Eoedref (Auto)

## 2. Analysis

### 2.1 Hardening Soil (Example : Validation of Hardening behavior)

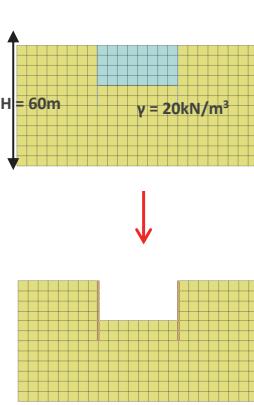

Parameter	Input value (kN, m)
E	50,000
c	30
$\phi$	36
$\psi$	5

[MC model]	
Parameter	Input value (kN, m)
E50ref	25,000
Eoedref	25,000
Eurref	75,000
m	0.5
c	30
$\phi$	36
$\psi$	5
Rf	0.9
Pref	100
KNC	0.5

[MMC model]	
Parameter	Input value (kN, m)
Auto (Shear Hardening)	
Pc	600 (OCR = 1)
$\alpha$	Auto (unchecked)
$\beta$	Auto (unchecked)

[1<sup>st</sup> Excavation]

[MC model]
[MMC model]
[MMC with Hardening]

[Vertical Displacement]
[Horizontal Displacement]

[MC model]
[MMC model]
[MMC with Hardening]

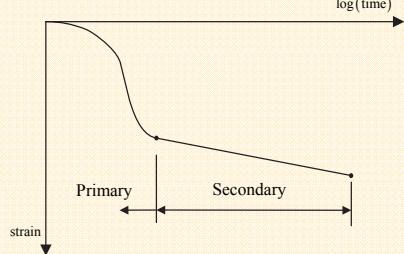

[Bending Moment of wall]

[MC model]
[MMC model]
[MMC with Hardening]

## 2. Analysis

### 2.2 Soft Soil Creep (Secondary Consolidation)

- Based on the 1D – creep theory, an extension was made to a 3D- model.
- Stress-dependent stiffness ( Parameters can be estimated from Compression and Recompression index (Cc,Cs))
- Consider Secondary (time-dependent) consolidation and pre-consolidation stress
- Failure parameters as in Mohr-Coulomb model
- In case that time-dependent behavior is critical, this model is applicable to estimate the creep from FE analysis.

Material	
ID	1
Name	Isotropic
Color	<span style="background-color: #FF8C00;"></span>
Model Type	Soft Soil Creep
<input type="checkbox"/> Structure	
<input checked="" type="radio"/> General	
<input type="radio"/> Porous	
<input type="radio"/> Non-Linear	
<input checked="" type="radio"/> Time Dependent	
Over Consolidation Ratio (OCR)	1
Slope of Consol Line (Lambda)	0.3
Slope of Over Consol Line (k)	0.05
KNC	1
Pc	0 <small>kN/m<sup>2</sup></small>
<input type="checkbox"/> User Defined	0.22
<input type="checkbox"/> Cap Shape Factor (Alpha)	30 <small>kN/m<sup>2</sup></small>
Cohesion (C)	30 <small>kN/m<sup>2</sup></small>
Friction Angle (Phi)	36 [deg]
<input checked="" type="checkbox"/> Dilatancy Angle	0 [deg]
<input checked="" type="radio"/> General	
<input type="radio"/> Porous	
<input type="radio"/> Non-Linear	
<input checked="" type="radio"/> Time Dependent	
Creep Index ( $\alpha$ )	0.01
<input type="button"/> OK <input type="button"/> Cancel <input type="button"/> Apply	

Parameter	Description	Reference value (kN, m)
Soil stiffness and failure		
$\lambda$	Swelling index	$Cc / 2.303 / (1 + e)$
$\kappa$	Compression index	$Cs / 2.303 / (1 + e)$ ( $Cc / 5$ for a rough estimation)
$\mu$	Creep index	$Cc / 20$ for a rough estimation
c	Cohesion	Failure parameter as in MC model
$\phi$	Friction angle	Failure parameter as in MC model
$\psi$	Dilatancy angle	0
Advanced parameters (Recommend to use Reference value)		
KNC	Ko for normal consolidation	$1 - \sin\phi < 1$
Cap yield surface		
OCR / Pc	Over Consolidation Ratio / Pre-overburden pressure	When entering both parameters, Pc has the priority of usage
$\alpha$	Cap Shape Factor (scale factor of preconsolidation stress)	from KNC (Auto)

## 2. Analysis

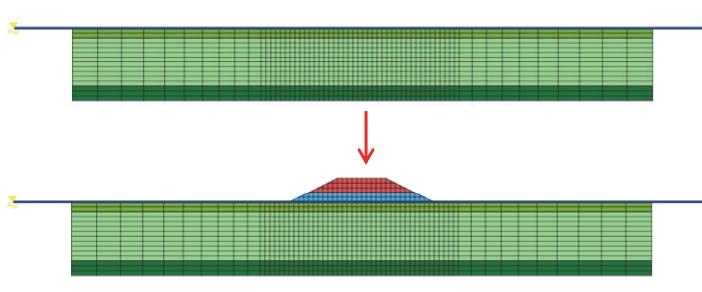

### 2.2 Soft Soil Creep (Example : Validation of Creep behavior)

Parameter	Reference value (kN, m)
$\lambda$	0.313
$\kappa$	0.063
M	1.113
OCR	2.05
$\alpha$	Auto

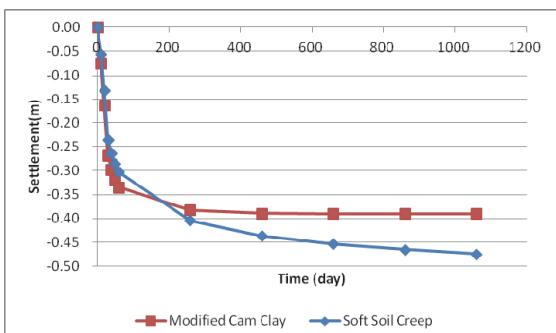

[MCC model]

Parameter	Reference value (kN, m)
$\lambda$	0.313
$\kappa$	0.063
$\mu$	0.01
c	10
$\phi$	28
$\psi$	0
KNC	0.5
OCR	2.05
$\alpha$	Auto (uncheck)

[Soft Soil Creep model]

[Embankment with Time]

[Result comparison : Secondary consolidation]

## 2. Analysis

## 2.3 Geometric Nonlinear Effects (Estimate Initial configuration)

- **Analysis > Analysis Case > General > Analysis Control**
  - Consider geometric nonlinear effects in stress, fully coupled and slope stability analysis.
  - Analysis can take into account load nonlinearity. Reflecting the effects of follower loads, where the load direction changes with the deformation.
  - In case of large deformation analysis, the user can check more reasonable behavior.
  - In case of embankment, "Initial Configuration" option in General tab is applicable to check more realistic behavior.

**Analysis Control**

- General** (highlighted)
- Nonlinear**
- Age**

**Geometry Nonlinearity**

- Consider Geometric Nonlinear Effects
- Update Pore Pressure with Deformation

**Initial Configuration**

- Estimate initial configuration of Activated nodes

**Normal pressure**      **Pressure in specified direction**

[Directional change of pressure load due to the large deformation]

[Staged Consolidation analysis for embankment]

[Geometric nonlinearity + Initial configuration option]

[Linear geometry without option]

**Result comparison**

Time (day)	Settlement (m) - Geometry Nonlinearity	Settlement (m) - Linear Geometry
0	0.00	0.00
25	-0.05	-0.05
50	-0.10	-0.10
75	-0.15	-0.15
100	-0.18	-0.18
125	-0.22	-0.22
150	-0.30	-0.28
175	-0.42	-0.38
200	-0.50	-0.48
225	-0.55	-0.55

## 2. Analysis

**2.4 Concrete Creep & Shrinkage (Time-dependent behavior) → Refer to Appendix in detail...**

- **Analysis > Analysis Case > General > Analysis Control** → The user can define Time Steps to check the results with time elapse  
(Available in **Nonlinear and Construction stage** (Stress) analysis)
  - **Mesh > Prop./Csys./Func. > Material > Isotropic** → The user can define Creep Formulation to simulate time-dependent behavior of concrete structures  
(Following constitutive models are available for concrete structures, **Elastic, Tresca, von Mises, MC, Drucker Prager, and Hoek brown**)
  - **Mesh > Prop./Csys./Func. > Function > Creep / Shrinkage Function** → The user can define Creep/Shrinkage Function based on the embedded **design codes(17ea)**
  - **Mesh > Prop./Csys./Func. > Function > Elastic Modulus Function** → The user can define time dependent Elastic Modulus Function based on embedded **design codes(12ea)**

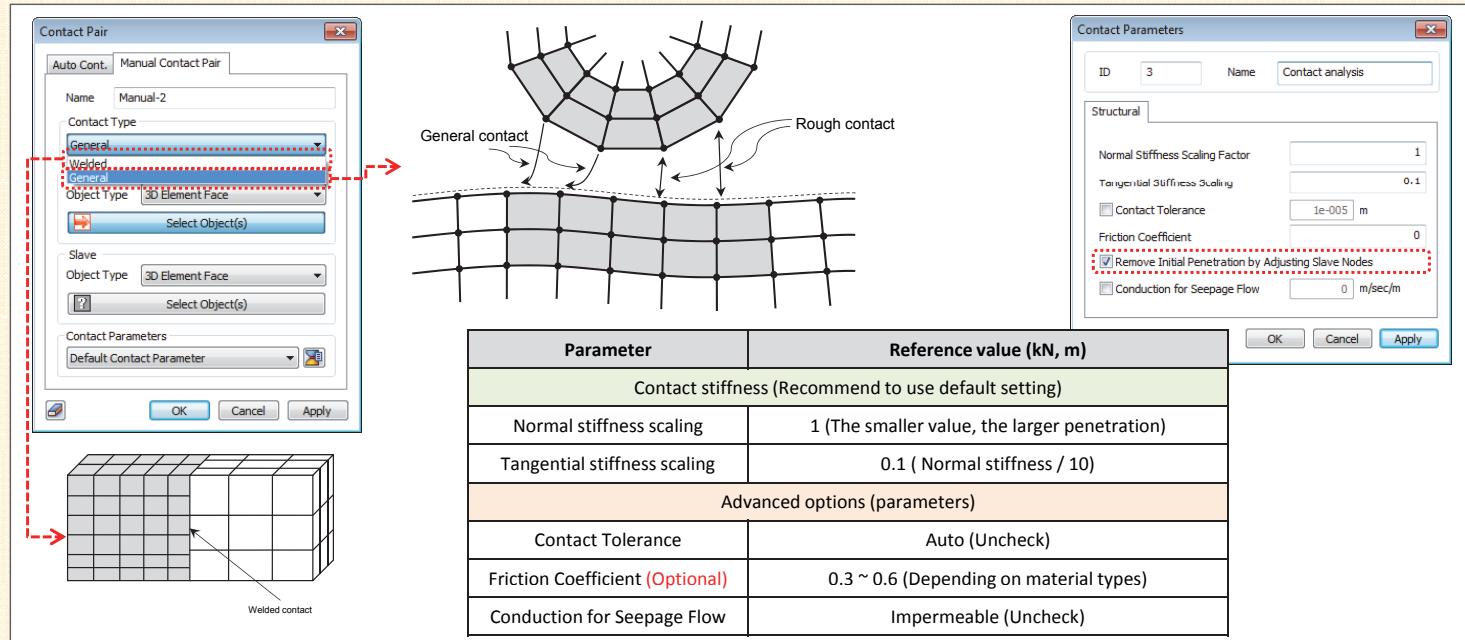

The figure displays several dialog boxes from the SAP2000 software:

- [Analysis Control / Time step]**: Shows the "Time Step" settings: Time(Per elmt) = 1000 day, Number of Increments = 10, Intermediate Output Request = Every Increment, and Manual with User-defined Steps.
- [Analysis Control / Age concrete]**: Shows the "Age" tab of the Analysis Control dialog, where a Mesh set named "Concrete" is defined with an age of 28.00 days.
- [Creep Formulation / Material]**: Shows the "Creep Formulation" dialog for a material named "Concrete". It includes sections for Creep Formulation (Age Independent), Reference Temperature (0 °F), Temperature-Dependent Rate (1e-009), Threshold Stress (0.01 kN/mm²), and Coefficient of Empirical Model. The empirical law is given as  $\epsilon'(\sigma, t) = A(\sigma)[1 - e^{-R(\sigma)t}] + K(\sigma)t$ . Parameters A, R, K, and coefficients a, b, c, d, e, f, g are listed.
- Creep/Shrinkage by Design Code**: Shows the "Creep Shrinkage Function" dialog. It lists various design codes: CEB-FIP(1990) (selected), CEB-FIP(1978), ACI, 1 (3.0) European, 2 (4.6) AS 3600-2009, 3 (5.2) Russian, 4 (5.8) JAPAN, 5 (6.4) Korean Standard, 6 (7.0) ITG (ITG 062-2004), 7 (7.5) China (JTG D62-2004), 8 (26) KSCE 2010, 9 (27) CEB-FIP(2010), 10 (30) ACI 318-14, 11 (48.8099) 10046.8, 49 (49.0000), and 12 (61.6111) 10081.6, 49 (49.0000). Buttons for "Generate Loading Ages", "Show Creep", and "Show Shrinkage" are present.
- Elastic Modulus Function**: Shows the "Elastic Modulus Function" dialog for a material named "Concrete". It lists various codes: CEB-FIP(1990) (selected), CEB-FIP(1978), Otsugi, ACI, 1 (3.0) European, 2 (4.6) AS 3600-2009, 3 (5.2) Russian, 4 (5.8) JAPAN, 5 (6.4) Korean Standard, 6 (7.0) ITG (ITG 062-2004), 7 (7.5) China (JTG D62-2004), 8 (26) KSCE 2010, 9 (27) CEB-FIP(2010), 10 (30) ACI 318-14, 11 (48.8099) 10046.8, 49 (49.0000), and 12 (61.6111) 10081.6, 49 (49.0000). A graph of Elastic Modulus vs. Age is shown.
- Creep Function Properties**: Shows the "Creep Function Properties" dialog for a material named "Concrete". It lists various codes: CEB-FIP(1990) (selected), CEB-FIP(1978), Otsugi, ACI, 1 (3.0) European, 2 (4.6) AS 3600-2009, 3 (5.2) Russian, 4 (5.8) JAPAN, 5 (6.4) Korean Standard, 6 (7.0) ITG (ITG 062-2004), 7 (7.5) China (JTG D62-2004), 8 (26) KSCE 2010, 9 (27) CEB-FIP(2010), 10 (30) ACI 318-14, 11 (48.8099) 10046.8, 49 (49.0000), and 12 (61.6111) 10081.6, 49 (49.0000). A graph of Creep Function vs. Age is shown.

## 2. Analysis

### 2.5 General Contact Element (Contact Analysis)

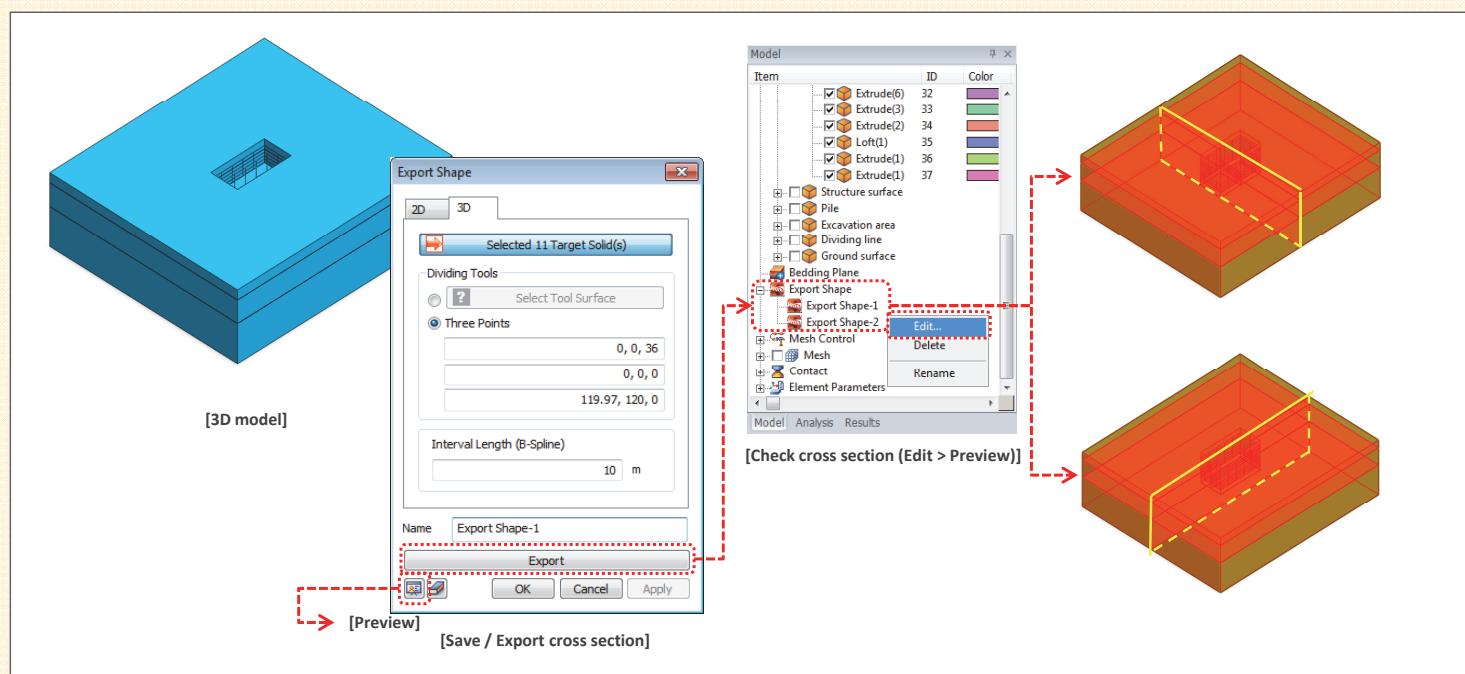

- Analysis Methods > Contact > Define Contact (Contact Type > General) → Only available in 3D model**
- General contact** considers the impact and impact friction between two objects in analysis, otherwise two objects are bonded (like rigid link) each other by Welded contact
- General contact can be used in nonlinear (static, dynamic) and fully coupled analysis. With **Geometric Nonlinearity** option, solver will take into account all possible contact area automatically regardless of the distance (defined Contact tolerance) between two objects
- The user can consider Frictional behavior by Friction coefficient between two objects
- The penetration at initial stage can be ignored automatically

## 3. Post Processing

### 3.1 3D → 2D Section (Save & Export to SoilWorks)

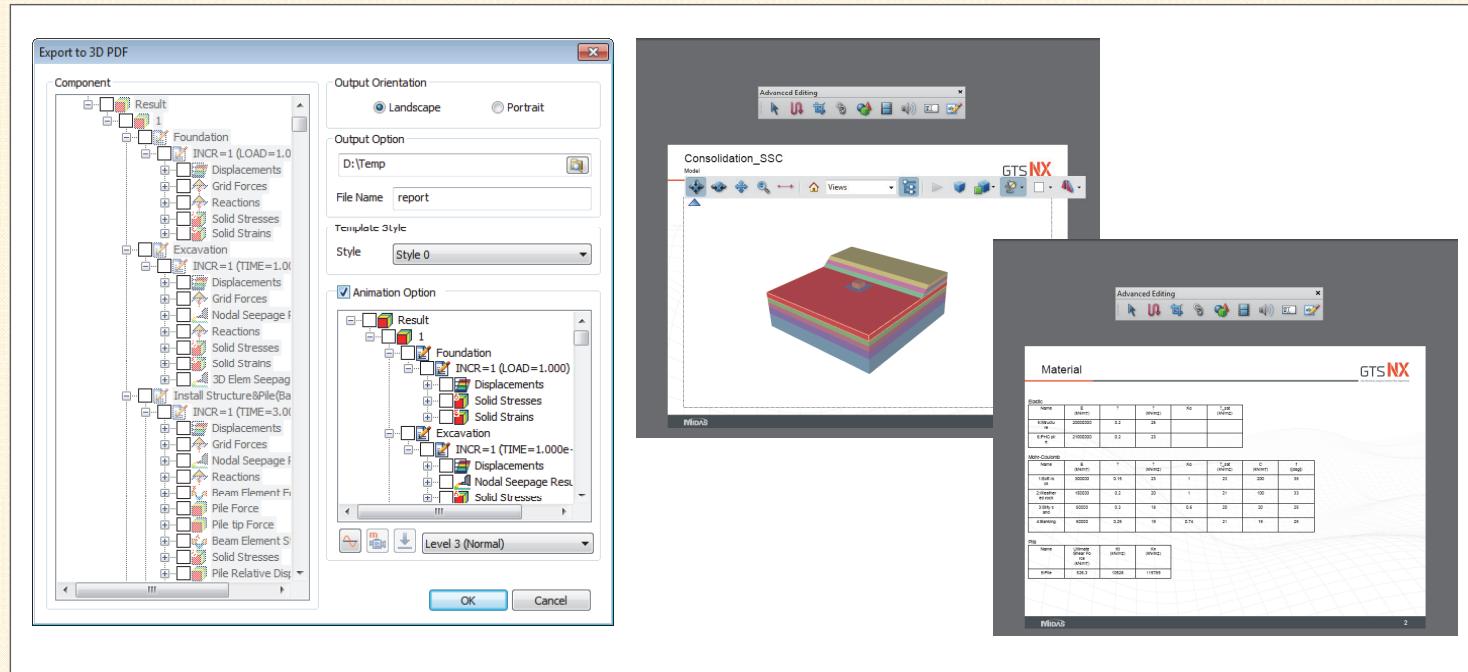

- File > Export > SoilWorks Neutral Format File (.FPN)**
- The user can export any cross section of 3D model to SoilWorks
- The user can save more than two section profiles and check the shape in Model tree
- The user can use the exported shape as a geometry to generate 2D mesh in SoilWorks, in case of cross checking the results from 3D and 2D model

### 3. Post Processing

#### 3.2 Improvement in 3D PDF Report (Material / Property table & Animation Option)

- Tools > Export 3D PDF > Export 3D PDF**
- The user can generate 3D PDF report automatically
- The report includes model information (material, geometry and mesh) and all types of results with animation like simulation of construction sequence
- Adobe reader is required to check the report

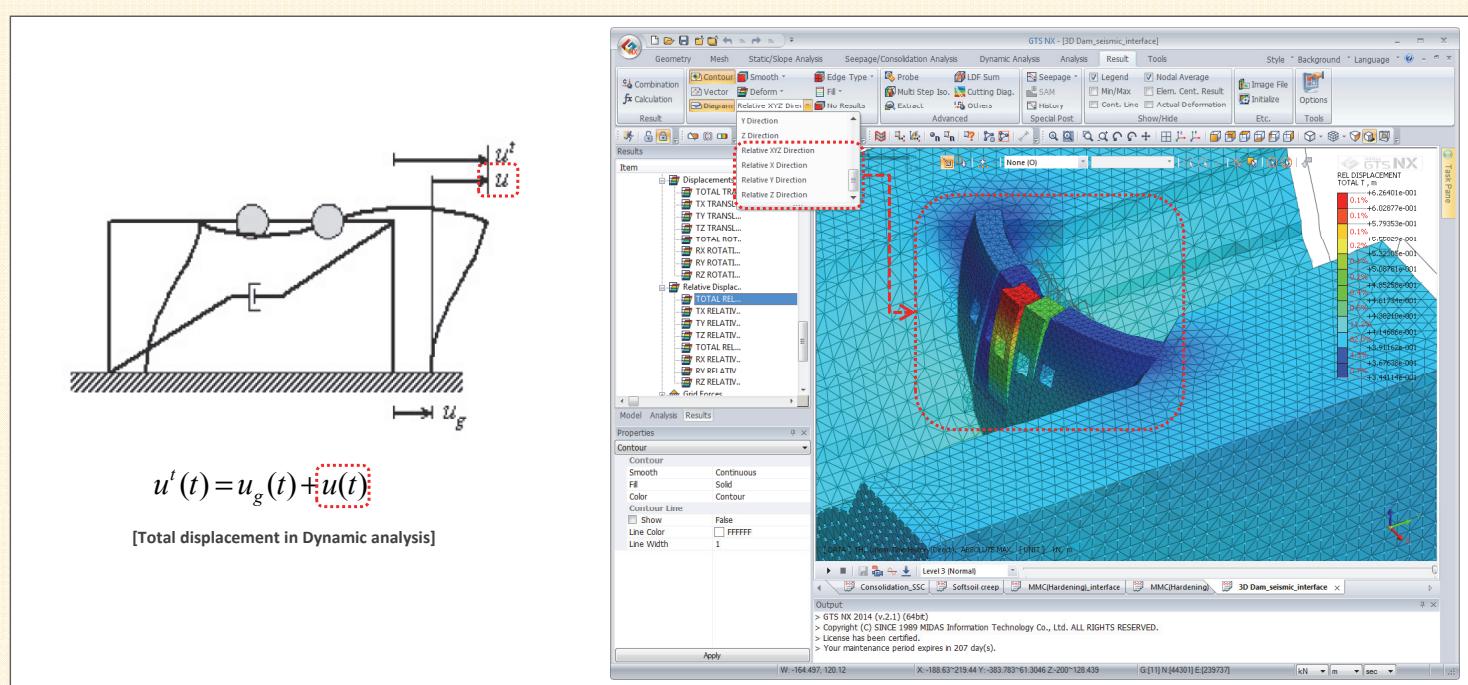

17 / 31

### 3. Post Processing

#### 3.3 Relative deformed shape for Dynamic analysis results

- Result > General > Deformed shape (Direction)**
- In case of seismic analysis, the bottom of ground can be fixed by ground acceleration. The user could check only total (absolute) deformed shape in the previous version.
- The user can check the deformed shape based on the relative displacement

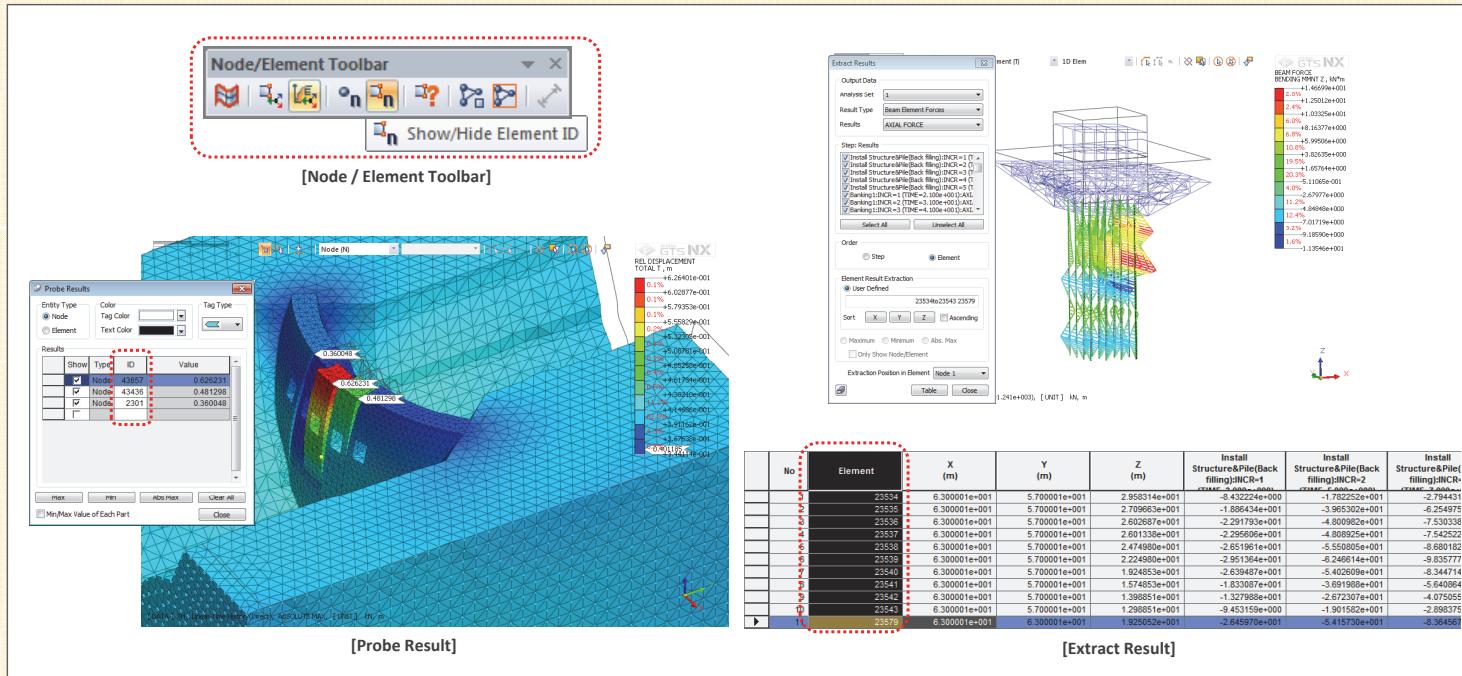

18 / 31

### 3. Post Processing

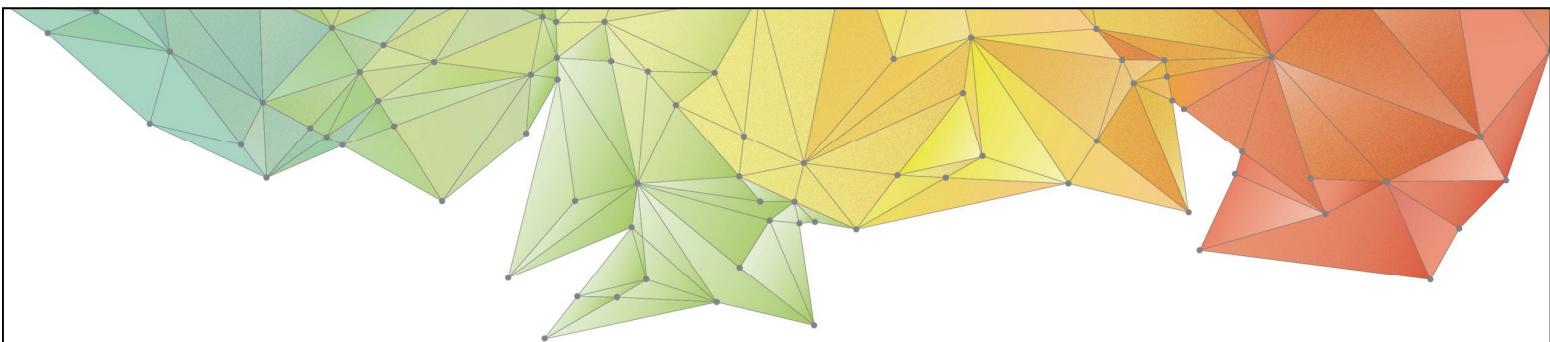

#### 3.4 Improvement in Probe Result (3D PDF Report (Material / Property table & Animation Option))

- Result > Advanced > Probe (Result Tag)**

- The user can check Node and Element ID in the table
- The user can check the result and its location in the model based on Node / Element ID

19 / 31

## Appendix

1. Time Steps / Creep Formulation
2. Creep / Shrinkage Function Group - **Design code**
3. Elastic Modulus Function - **Design code**

Integrated Solver Optimized for the next generation 64-bit platform  
Finite Element Solutions for Geotechnical Engineering

## 1. Time Steps / Creep Formulation

- The user can define Total elapsed time and the number of increments to output results for each time step. Uniform and non-uniform time steps can be defined
- In case of construction stage analysis, the user can take Age into account to consider creep/shrinkage effect generated in the previous stage. In general, the user can enter the curing period of concrete
- Two types of creep formulation are available to define Time-dependent behavior of material (**Age Dependent** and **Age Independent**)

Time Steps  
 Time(Duration)  day  
Number of Increments   
Intermediate Output Request   
 Manual with User-defined Steps

[Analysis Control / Time step]

Time Steps  
 Time(Duration)  day  
Number of Increments   
Intermediate Output Request   
 Manual with User-defined Steps

[Analysis Control / Age concrete]

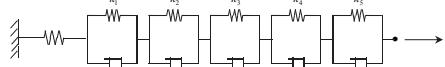

Time Steps  
 Time(Duration)  day  
Number of Increments   
Intermediate Output Request   
 Manual with User-defined Steps

[Creep Formulation / Material]

**[Age Dependent]**

The stiffness of concrete changes with time, and the creep and shrinkage may cause unexpected deformation. And the creep strain of concrete depends on the time of stress occurrence even under the same applied load.

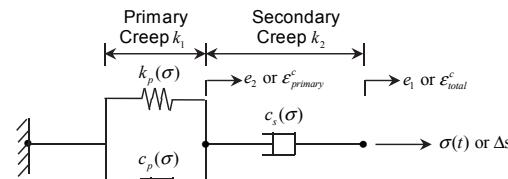

GTSNX supports aging-Kelvin model and aging-Viscous model excluding the spring from Kelvin model.

[Schematic view of aging-Kelvin creep model]

**[Age Independent]**

GTSNX can take into account the primary and secondary creep. The user can use two types of empirical law to define the creep behavior.

[Kelvin-Maxwell creep model]

## 2. Creep / Shrinkage Function – Design code

**Creep/Shrinkage Function Group**

Code: CEB-FIP(1990)

CEB-FIP(1990)  
Characteristic compressive strength of concrete at the age of 28 days( $f_{ck}$ )  kN/m<sup>2</sup>  
Relative Humidity of ambient environment (40-99)  %  
Notational size of member  
 $h = 2 * A_c / u$  ( $A_c$ : Section Area,  $u$ : Perimeter in contact with atmosphere)  
Type of Cement  
 Rapid hardening high strength cement (RS)  
 Normal or rapid hardening cement (N, R)  
 Slowly hardening cement (SL)  
Age of concrete at the beginning of shrinkage  day

[CEB-FIP(1990)]

**Notational size of member**  
-Conceptual (Equivalent) size of structure. Two times of equivalent area divided by perimeter of the member

**Age of concrete at the beginning of shrinkage**  
-The number of days elapsed after pouring of concrete, when the shrinkage is assumed to start

**Creep/Shrinkage Function Group**

Code: CEB-FIP(1978)

CEB-FIP(1978)  
Characteristic compressive strength of concrete at the age of 28 days( $f_{ck}$ )  kN/m<sup>2</sup>  
Relative Humidity of ambient environment (40-100)  %  
Notational size of member  
 $h = 2 * A_c / u$  ( $A_c$ : Section Area,  $u$ : Perimeter in contact with atmosphere)  
Type of Cement  
 Normal and slowly-hardening cements  
 Rapid-hardening cements  
 Rapid-hardening high-strength cements  
Age of concrete at the beginning of shrinkage  day

[CEB-FIP(1978)]

**Notational size of member**  
-Conceptual (Equivalent) size of structure. Two times of equivalent area divided by perimeter of the member

**Age of concrete at the beginning of shrinkage**  
-The number of days elapsed after pouring of concrete, when the shrinkage is assumed to start

**Creep/Shrinkage Function Group**

Code: ACI

ACI  
Compressive strength of concrete at the age of 28 days  kN/m<sup>2</sup>  
Relative Humidity of ambient environment (40-99)  %  
Volume-surface ratio  m  
Age of concrete at the beginning of shrinkage  day  
Init Curing Method  moist cure  steam cure  
Concrete Compressive Strength Factor (a, b)  
 $a = \frac{f_{ck}}{f_{ck}^{ref}}$  ( $0.05 \sim 0.25$ )  $b = \frac{f_{ck}^{ref}}{f_{ck}}$  ( $0.67 \sim 0.98$ )  
Material factored ultimate value  
Type  
 ACI Code  User  
Slump  m  
Fine aggregate percentage  %  
Air content  %  
Cement content  kg/m<sup>3</sup>

[ACI]

**Age of concrete at the beginning of shrinkage**  
-The number of days elapsed after pouring of concrete, when the shrinkage is assumed to start

**Material factored ultimate value**  
- The user may enter the ultimate values considering concrete properties by ACI code or User type.

## 2. Creep / Shrinkage Function – Design code

**Creep/Shrinkage Function Group**

Code: PCA

**PCA**

- Compressive strength of concrete at the age of 28 days (fc)  kN/m<sup>2</sup>
- Ultimate shrinkage strain (500~800)  E-6
- Ultimate creep strain (3~5)  1/fc<sup>E-3</sup>
- Relative Humidity of ambient environment (40~99)  %
- Volume-surface Ratio (v/s)  m
- Reinforcement ratio of cross section of column segment  %
- Modulus of elasticity of steel  kN/m<sup>2</sup>

**OK Cancel**

[PCA]

**Creep/Shrinkage Function Group**

Code: Combined (ACI & PCA)

**Combined (ACI & PCA)**

- Compressive strength of concrete at the age of 28 days (fc)  kN/m<sup>2</sup>
- Relative humidity of ambient environment (40~100)  %
- Volume-surface ratio (v/s)  m
- Creep**
  - Material factored ultimate creep strain  (E-6) m/m/dN/m<sup>2</sup>
  - Volume-surface Ratio (v/s-inches)  (E-6)
  - (2/3) \* (1+1.13e^(-0.54 v/s)) (ACI Code)
  - (0.044 v/s+0.934) / (0.1 v/s+0.85) (PCA)
  - Loading aged factor (t: loading age)
    - 1.25 \* t^(0.118) (moist cured ACI Code)
    - 1.13 \* t^(0.094) (steam cured ACI Code)
    - 2.3 \* t^(0.25) (PCA)
  - Progress of Creep with Time
    - (t) / (35 + t) (moist cured ACI Code)
    - (t) / (55 + t) (steam cured ACI Code)
    - (t) / (26e^(-0.36 v/s) + t) (v/s-inches) (by PCA)
- Reinforced Concrete effect by PCA
- Reinforcement ratio of cross section of column segment  %
- Modulus of elasticity of steel  kN/m<sup>2</sup>

**OK Cancel**

[Combined (ACI &amp; PCA)]

### Material factored ultimate creep strain / Shrinkage

- The user may enter the ultimate values considering concrete properties by User type.

**Creep/Shrinkage Function Group**

Code: AASHTO

**AASHTO**

- Compressive strength of concrete at the age of 28 days  kN/m<sup>2</sup>
- Relative Humidity of ambient environment (40~99)  %
- Volume-surface ratio  m
- Age of concrete at the beginning of shrinkage  day
- Expose to drying before 5 days of curing

**OK Cancel**

[AASHTO]

### Expose to drying before 5 Days of curing

- If this option is checked on, the influence of Creep & Shrinkage is increased by 20% (ref. AASHTO 5.4.2.3)

## 2. Creep / Shrinkage Function – Design code

**Creep/Shrinkage Function Group**

Code: European

**European**

- Characteristic compressive cylinder strength of concrete at the age of 28 days (fc)  kN/m<sup>2</sup>
- Relative Humidity of ambient environment (40~99)  %
- Notational size of member  m
- $h = 2 * Ac / u$  (Ac : Section Area, u : Perimeter in contact with atmosphere)
- Type of Cement
  - Class S
  - Class N
  - Class R
- Type of code
  - EN 1992-1 (General Structure)
  - EN 1992-2 (Concrete Bridge)
- Use of silica-fume
- Age of concrete at the beginning of shrinkage  day

## 2. Creep / Shrinkage Function – Design code

**Creep/Shrinkage Function Group**

Code: Russian

Russian

Concrete Class, B: 30000 kN/m<sup>2</sup>

Relative humidity of ambient environment: 70 %

Module of an exposed surface, M: 1 /m

Age of concrete at the beginning of shrinkage: 3 days

Curing Method: Natural cure

Cement Type:

- Normal
- Fast-hardened
- Slag
- Pozzolan

Concrete Type:

- Fast-accumulating creep
- Heavy concrete (N)
- Fine-grained concrete (M)

Water content, W: 180 L/m<sup>3</sup>

Maximum aggregate size: 2e-005 m

Air content, V: 30 L/m<sup>3</sup>

Specific content of the cement paste, p<sub>c</sub>: 0.25

**OK** **Cancel**

[Russia]

**Age of concrete at the beginning of shrinkage**

-The number of days elapsed after pouring of concrete, when the shrinkage is assumed to start

**Fast – accumulating creep**

- If this option is checked on, the influence of Creep & Shrinkage will be increased by % based on Russian code

**Creep/Shrinkage Function Group**

Code: Korean Standard

Korean Standard

Characteristic compressive strength of concrete at the age of 28 days (f<sub>ck</sub>): 2400000 kN/m<sup>2</sup>

Relative humidity of ambient environment(40 ~ 99): 70 %

Notational size of member: 1.2 m

$h = 2 * A_c / u$  (A<sub>c</sub> : Section Area, u : Perimeter in contact with atmosphere)

Type of cement:

- Rapid hardening high strength cement (HS)
- Normal or rapid hardening cement (N, R)
- Slowly hardening cement (SL)

Age of concrete at the beginning of shrinkage: 3 days

**OK** **Cancel**

[ACI]

- Modulus of elasticity, which will be reflected in the analysis, is calculated using the compressive strength of concrete and weight density

$$E_e = w_c^{1.5} 0.043 \sqrt{f'_c} \quad (\text{in MPa})$$

$w_c$  : Density of concrete, kg/m<sup>3</sup>

$f'_c$  : Compressive strength of concrete, MPa

### 3. Elastic Modulus Function – Design code

**Design Strength**

Code: Ohzagı

Concrete compressive strength at 28 days (f<sub>28</sub>) : 30000 kN/m<sup>2</sup>

Cement Type (a, b, c)

- N, R
- RS
- N, R**
- SL
- Fly ash

End Time : 10000 day

Num. of steps : 48

OK Cancel

**Design Strength**

Code: European

Mean compressive strength of concrete at the age of 28 days (f<sub>c28+delta\_f</sub>) : 30000 kN/m<sup>2</sup>

Cement Type(s)

- Class N : 0.25
- Class R : 0.20
- Class N : 0.25
- Class E : 0.38**

End Time : 10000 day

Num. of steps : 48

OK Cancel

**Design Strength**

Code: AS 3600-2009

Concrete compressive strength at 28 days (f<sub>28</sub>) : 30000 kN/m<sup>2</sup>

End Time : 10000 day

Num. of steps : 48

OK Cancel

#### [Ohzagı]

The equation proposed by Ohzagı is used to define the change of compressive strength of concrete. Specify the Concrete Compressive Strength at 28 Days and Cement Type

**RS** – Rapid hardening high strength cements

**N,R** – Normal or rapid hardening cements

**SL** – Slowly hardening cements

**Fly ash** – Fly ash cementing material

#### [European]

Specify the Concrete Compressive Strength at 28 Days and Cement Type

**RS** – Rapid hardening high strength cements

**N,R** – Normal or rapid hardening cements

**SL** – Slowly hardening cements

#### [AS 3600-2009]

- Mean modulus of elasticity of concrete at the appropriate age is calculated as follows.

$$f_{cmi} \leq 40 \text{ MPa}, E_{ej} = (\rho^{1.5}) \times (0.043 \sqrt{f_{cmi}})$$

$$f_{cmi} > 40 \text{ MPa}, E_{ej} = (\rho^{1.5}) \times (0.024 \sqrt{f_{cmi}} + 0.12)$$

- Since there is no equation for Compressive Strength at the appropriate age in Australian Standard, it is calculated based on the following equation specified in CEB-FIP 1978.

$$f(t) = \frac{1.451849874 \times t^{0.75} \times f_c'}{t^{0.75} + 5.5}$$

### 3. Elastic Modulus Function – Design code

**Design Strength**

Code: AS/RTA 5100.5-2011

Concrete compressive strength at 28 days (f<sub>28</sub>) : 30000 kN/m<sup>2</sup>

End Time : 10000 day

Num. of steps : 48

OK Cancel
